Description

RARy Luciferase Reporter HEK293 Cell Line is a HEK293 cell line engineered to express firefly luciferase, under the control of retinoic acid response elements (RARE), and with full length human RARy (retinoic acid receptor gamma) (accession # P13631-1). RARy Luciferase Reporter HEK293 Cell Line is designed for monitoring the activity of RARy. This cell line was functionally validated by stimulation with all-trans retinoic acid and Western Blot analysis.

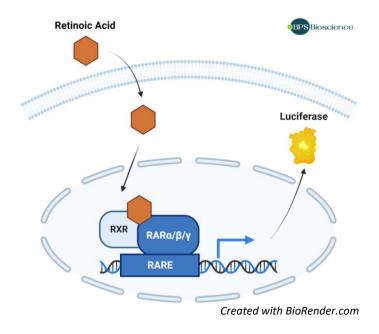

Figure 1: Illustration of the mechanism of action of RARy Luciferase Reporter HEK293 Cell Line. Upon activation with retinoic acid, RAR dimerizes with RXR, and activates RARE and luciferase expression. The level of activation corresponds directly to the luciferase signal.

Background

Retinoic acid receptor gamma (RAR γ), also known as NR1B3 (nuclear receptor subfamily 1, group B, member 3) belongs to the family of nuclear receptors and has three subtypes, RAR α , RAR β , and RAR γ . RAR heterodimerizes with retinoic X receptor (RXR) and acts as a transcription factor that regulates the growth and differentiation of both normal and malignant cells. When RAR binds to its ligands, all-*trans* retinoic acid or 9-*cis* retinoic acid, RAR/RXR heterodimer binds to retinoic acid response elements in the promoter region of target genes and recruits coactivator proteins, leading to transcription and expression of the downstream target genes. RAR γ can be found in T cells and it is involved in thymocyte development and CD8 $^+$ T cell responses. It is present at high levels in hematopoietic stem cells during hematopoiesis. It can act as an oncogene, leading to colorectal, renal and hepatocellular carcinoma and acute myeloid leukemia (AML). The development of RAR antagonists, either selective or pan-specific, may prove a useful treatment option in cancer therapy.

Application

- Monitor RARγ-regulated pathway activity.
- Screen for agonists or antagonists of RARy.

Materials Provided

Components	Format
2 vials of frozen cells	Each vial contains >1 x 10 ⁶ cells in 1 ml of Cell Freezing
	Medium (BPS Bioscience #79796)

Parental Cell Line

HEK293, Human Embryonic Kidney, epithelial-like cells, adherent

Mycoplasma Testing

The cell line has been screened to confirm the absence of Mycoplasma species.

Materials Required but Not Supplied

These materials are not supplied with the cell line but are necessary for cell culture and cellular assays. BPS Bioscience's reagents are validated and optimized for use with this cell line and are highly recommended for best results. Media components are provided in the Media Formulations section below.

Media Required for Cell Culture

Name	Ordering Information	
Thaw Medium 6	BPS Bioscience #60183	
Growth Medium 6A	BPS Bioscience #79542	
Materials Required for Cellular Assay Name Ordering Information		
ATRA	Sigma #R2625	
Assay Medium 6A	BPS Bioscience #82211	
96-well tissue culture treated white clear-bottom assay plate	Corning #3610	
ONE-Step™ Luciferase Assay System	BPS Bioscience #60690	
Luminometer		

Storage Conditions

Cells are shipped in dry ice and should immediately be thawed or stored in liquid nitrogen upon receipt. Do not use a -80°C freezer for long term storage. Contact technical support at support@bpsbioscience.com if the cells are not frozen in dry ice upon arrival.

Media Formulations

For best results, the use of validated and optimized media from BPS Bioscience is *highly recommended*. Other preparations or formulations of media may result in suboptimal performance.

Note: Thaw Media do *not* contain selective antibiotics. However, Growth Media *do* contain selective antibiotics, which are used to maintain selective pressure on the cell population expressing the gene of interest.

Cells should be grown at 37°C with 5% CO₂. BPS Bioscience's cell lines are stable for at least 10 passages when grown under proper conditions.

Media Required for Cell Culture

Thaw Medium 6 (BPS Bioscience #60187):

DMEM medium supplemented with 10% FBS, 1% Penicillin/Streptomycin.

Growth Medium 6A (BPS Bioscience #79542):

DMEM medium supplemented with 10% FBS, 1% Penicillin/Streptomycin plus 400 μ g/ml of Geneticin (G418), 1 μ g/ml of Puromycin, and 100 μ g/ml Hygromycin B.

Media Required for Functional Cellular Assay

Assay Medium 6A (BPS Bioscience #82211):

Phenol red-free DMEM, 10% Charcoal Stripped FBS, and 1% Penicillin/Streptomycin.

Cell Culture Protocol

Note: HEK293 cells are derived from human material and thus the use of adequate safety precautions is recommended.

Cell Thawing

- 1. Swirl the vial of frozen cells for approximately 60 seconds in a 37°C water bath. As soon as the cells are thawed (it may be slightly faster or slower than 60 seconds), quickly transfer the entire contents of the vial to a tube containing 10 ml of pre-warmed Thaw Medium 6.
 - Leaving the cells in the water bath at 37°C for too long will result in rapid loss of viability.
- 2. Immediately spin down the cells at 300 *x g* for 5 minutes, remove the medium and resuspend the cells in 5 ml of pre-warmed Thaw Medium 6.
- 3. Transfer the resuspended cells to a T25 flask and incubate at 37°C in a 5% CO₂ incubator.
- 4. After 24 hours of culture, check for cell attachment and viability. Change medium to fresh Thaw Medium 6 and continue growing in a 5% CO₂ incubator at 37°C until the cells are ready to passage.
- 5. Cells should be passaged before they are fully confluent. At first passage and subsequent passages, use Growth Medium 6A.

Cell Passage

- 1. Aspirate the medium, wash the cells with phosphate buffered saline (PBS) without Ca²⁺/Mg²⁺, and detach the cells from the culture vessel with 0.05% Trypsin/EDTA.
- 2. Once the cells have detached, add Growth Medium 6A and transfer to a tube.
- 3. Spin down the cells at 300 x g for 5 minutes, remove the medium and resuspend the cells in Growth Medium 6A.
- 4. Seed into new culture vessels at the recommended sub-cultivation ratio of 1:10 to 1:20 twice a week.

Cell Freezing

- 1. Aspirate the medium, wash the cells with PBS without Ca²⁺/Mg²⁺, and detach the cells from the culture vessel with 0.05% Trypsin/EDTA.
- 2. Once the cells have detached, add Growth Medium 1G and count the cells.-
- 3. Spin down the cells at 300 x g for 5 minutes, remove the medium and resuspend the cells in 4°C Cell Freezing Medium (BPS Bioscience #79796) at ~2 \times 10⁶ cells/ml.
- 4. Dispense 1 ml of cell suspension into each cryogenic vial. Place the vials in an insulated container for slow cooling and store at -80°C overnight.

5. Transfer the vials to liquid nitrogen the next day for long term storage.

Note: It is recommended to expand the cells and freeze at least 10 vials at an early passage for future use.

A. Dose response of RARy Reporter Luciferase HEK293 Cell Line to all-trans retinoic acid (ATRA)

- The following assays are designed for 96-well format. To perform the assay in different tissue culture formats, the cell number and reagent volumes should be scaled appropriately.
- The experiments should be performed in triplicate.
- The assay should include "Cell-Free Control", "Unstimulated Control" and "Test Condition" wells.

Assay Medium:

Assay Medium 6A.

- 1. The day prior to initiating the assay exchange the media used to culture RARy Reporter Luciferase HEK293 cells to Assay Medium.
- 2. Seed RARy Reporter Luciferase HEK293 cells at a density of \sim 30,000 cells in 40 μ l/well of Assay Medium into a white clear-bottom 96-well cell culture plate. Leave some wells with only Assay Medium for background determination.
- 3. Prepare a stock solution of ATRA in 100% DMSO at 1000-fold than the highest desired final concentration, then dilute it 200-fold with Assay Medium to prepare the highest concentration of the serial dilution. The concentration of DMSO is now 0.5% DMSO.

Prepare a serial dilution at the desired concentrations using Assay Medium containing 0.5% DMSO.

For controls use Assay Medium with 0.5% DMSO (Diluent Solution).

Note: The concentration of DMSO should not exceed 0.1% in the final reaction.

- 4. Add 10 μ l of the ATRA dilutions to the "Test Condition" cells.
- 5. Add 10 μ l of Diluent Solution to the "Unstimulated Control" and "Cell-Free Control" wells (for determining the background luminescence).
- 6. Incubate the cells at 37°C in a CO₂ incubator for 16 to 24 hours.
- 7. Add 100 μl of ONE-Step™ Luciferase Assay reagent to all wells.
- 8. Rock at room temperature for ~15 minutes.
- 9. Measure luminescence using a luminometer.

10. Data Analysis: Subtract the average background luminescence (cell-free control wells) from the luminescence reading of all wells. The fold induction of luciferase activity is the background-subtracted luminescence of stimulated cells divided by the average background-subtracted luminescence of unstimulated control wells.

$$Fold\ induction = \frac{Lumin.\,stimulated\ cells-ave.\,background}{Lumin.\,unstimulated\ cells-ave.\,background}$$

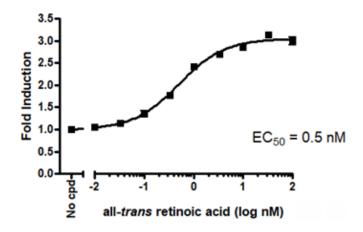

Figure 2: Dose response curve of RARy Luciferase Reporter HEK293 Cell Line to all-trans retinoic acid (ATRA).

Cells were incubated with increasing amounts of ATRA. Luciferase activity was measured using the ONE-Step™ Luciferase Assay System. Results are shown as fold induction of RAR luciferase reporter expression.

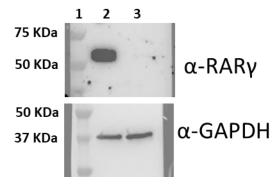

Figure 3: Expression of RARy in RARy Luciferase Reporter HEK293 Cell Line.

Western Blot analysis was performed in RARy Luciferase Reporter cells (lane 2) and HEK293 cells (lane 3) with Anti-Human RARy Antibody (Santa Cruz Biotech #sc-398065). The expression of GAPDH was used as loading control. Molecular Weight Markers are shown in lane 1.

Data shown is representative. For lot-specific information, please contact BPS Bioscience, Inc. at support@bpsbioscience.com.
