# Data sheet Spike S1 RBD (SARS-CoV-2): ACE2 Inhibitor Screening Colorimetric Assay Kit Catalog #78018 Size: 96 reactions

**DESCRIPTION:** The pandemic coronavirus disease 2019 (COVID-19) is caused by Severe Acute Respiratory Syndrome Coronavirus 2 (SARS-CoV-2). As a first step of the viral replication strategy, the virus attaches to the host cell surface before entering the cell. The Receptor Binding Domain (RBD) of Spike protein recognizes and attaches to the Angiotensin-Converting Enzyme 2 (ACE2) receptor found on the surface of type I and II pneumocytes, endothelial cells, and ciliated bronchial epithelial cells. Drugs targeting the interaction between the Spike protein of SARS-CoV-2 and ACE2 may offer some protection against the viral infection

The Spike RBD S1 (SARS-CoV-2):ACE2 Inhibitor Screening Colorimetric Assay Kit is designed for screening and profiling inhibitors of this interaction. This kit comes in a convenient 96-well format, with purified SARS-CoV-2 Spike S1 RBD and ACE2-Biotin proteins, streptavidin-HRP, colorimetric HRP substrate, and assay buffer for 100 binding reactions. The key to this kit is the high sensitivity of detection of ACE2-Biotin protein by Streptavidin-HRP. Only a few simple steps on a microtiter plate are required for the assay. First, Spike RBD protein is attached to a 96-well transparent plate. Next, ACE2-Biotin is incubated with Spike RBD on the plate. Finally, the plate is treated with streptavidin-HRP followed by addition of an HRP substrate to produce color, which can then be measured using a UV/Vis spectrophotometer microplate reader.

# **COMPONENTS:**

Catalog #	Component	Amount	Sto	rage
100696	Spike S1 RBD, Avi-His-tag (SARS-CoV-2)	5 µg	-80°C	
100665	ACE2, His-Avi-Tag, Biotin-labeled HiP™	5 µg	-80°C	
79742	Streptavidin-HRP	10 µl	+4°C	Avoid
79311	3x Immuno Buffer 1	50 ml	-20°C	freeze/
79728	Blocking Buffer 2	50 ml	+4°C	thaw
79651	Colorimetric HRP substrate	10 ml	+4°C	cycles!
79964	Transparent 96-well microplate	1	Room Temp	

**APPLICATIONS:** This kit is useful for screening for inhibitors of ACE2 binding to SARS-CoV-2 Spike S1 RBD.

**STABILITY:** Up to 6 months from date of receipt, when stored as recommended.

OUR PRODUCTS ARE FOR RESEARCH USE ONLY. NOT FOR DIAGNOSTIC OR THERAPEUTIC USE.

# MATERIALS OR INSTRUMENTS REQUIRED BUT NOT SUPPLIED:

PBS (Phosphate buffered saline) 1N HCI (aqueous) Rotating or rocker platform UV/Vis spectrophotometer microplate reader capable of reading absorbance at 450 nm\* \**Alternatively, a spectrophotometer reading at 650 nm may be used, but the sensitivity of the assay will be greatly reduced.* 

# ASSAY PROTOCOL:

All samples and controls should be tested in duplicate.

# Coating the plate with Spike S1 RBD:

- Thaw Spike S1 RBD on ice. Upon first thaw, briefly spin tube containing Spike S1 RBD to recover the full contents of the tube. Aliquot into single use aliquots. Immediately store remaining Spike S1 RBD in aliquots at -80°C. Note: Spike S1 RBD is very sensitive to freeze/thaw cycles. Avoid multiple freeze/thaw cycles.
- 2) Dilute **Spike S1 RBD** to 1 µg/ml in PBS.
- 3) Add 50 µl of diluted **Spike S1 RBD** solution to each well and incubate overnight at 4°C.
- 4) Dilute **3x Immuno Buffer 1** to **1x Immuno Buffer 1** with water. Dilute only the amount required for the assay; store remaining 3x Immuno Buffer 1 undiluted.
- 5) Decant to remove supernatant. Wash the plate three times with 100 µl 1x Immuno Buffer
  1. Tap plate onto clean paper towels to remove liquid.
- 6) Block wells by adding 100 μl of **Blocking Buffer 2** to each well. Incubate for 1 hour at room temperature with slow shaking. Remove supernatant as described in step 5.

#### Step 1:

- 1) Add 20 µl of 1x Immuno Buffer 1 to each well.
- 2) Add 10 µl of inhibitor solution to each well designated "Test Inhibitor." For the "Positive Control" and "Blank," add 10 µl of the same solution without inhibitor (inhibitor buffer). Optionally, incubate at room temperature for one hour with slow shaking.

Note: It is recommendable to use PBS to dilute antibodies or other proteins acting as neutralization inhibitors. When using small molecules dissolved in DMSO, final DMSO

OUR PRODUCTS ARE FOR RESEARCH USE ONLY. NOT FOR DIAGNOSTIC OR THERAPEUTIC USE.

concentration in the assay should be  $\leq 1\%$ . Inhibitor buffer should contain the same concentration of DMSO as the test inhibitor.

- 3) Thaw ACE2-Biotin on ice. Upon first thaw, briefly spin tube containing enzyme to recover full contents of the tube. Aliquot ACE2-Biotin into single use aliquots. Immediately store remaining undiluted enzyme in aliquots at -80°C. Note: ACE2-Biotin is very sensitive to freeze/thaw cycles. Do not re-use thawed aliquots or diluted enzyme.
- 4) Dilute ACE2-Biotin to 2.5 ng/µl (approximately 30 nM) in 1x Immuno Buffer 1. Keep diluted protein on ice until use. Discard any unused diluted protein after use.

	Blank	Positive Control	Test Inhibitor
1x Immuno Buffer 1	40 µl	20 µl	20 µl
Test Inhibitor	-	-	10 µl
Inhibitor buffer (no inhibitor)	10 µl	10 µl	-
ACE2-Biotin (2.5 ng/µl)	-	20 µl	20 µl
Total	50 µl	50 µl	50 µl

5) Add another 20 µl of 1x Immuno Buffer 1 to the wells designated "Blank".

- Initiate reaction by adding 20 μl of diluted ACE2-Biotin (see Step 1-4) to wells labeled "Positive Control" and "Test Inhibitor". Incubate at room temperature for one hour with slow shaking.
- Decant to remove supernatant. Wash the plate 3 times with 100 μl/well 1x Immuno Buffer
  Tap plate onto clean paper towels to remove liquid.
- 8) Block wells by adding 100 µl of **Blocking Buffer 2** to each well. Incubate for 10 minutes at room temperature. Remove supernatant as in Step 1-7.

# Step 2:

- 1) Dilute Streptavidin-HRP 1000-fold with Blocking Buffer 2.
- 2) Add 100 µl to each well. Incubate for 1 hour at room temperature with slow shaking.
- 3) Wash plate three times with **1x Immuno Buffer 1**. Tap plate onto clean paper towel to remove liquid.
- 4) Block wells by adding 100 µl of Blocking Buffer 2 to each well. Incubate for 10 minutes at room temperature. Decant to remove supernatant. Tap plate onto clean paper towels to remove liquid.

- 5) Add 100 µl of the Colorimetric HRP substrate to each well and incubate the plate at room temperature until blue color is developed in the positive control well. This usually takes 1-2 minutes to fully develop. However, the optimal incubation time may vary, and should be determined empirically by the user. "Blank" value is subtracted from all readings.
- 6) After the blue color is developed, add 100 μl of 1N HCl to each well. Read the absorbance at 450 nm using UV/Vis spectrophotometer microplate reader. The blank wells should exhibit an absorbance of ~ 0.05 at 450 nm. Alternatively, the plate may be read at 650 nm without adding 1N HCl, but the Signal-to-Background ratio will be decreased.

### **Example of Assay Results:**

ACE2-Biotin (BPS Bioscience, #100665) binding to immobilized SARS-CoV-2 Spike S1 RBD (BPS Bioscience, #100696) (left) and inhibition of the SARS-CoV-2 Spike S1 RBD:ACE2 binding by anti-SARS-CoV-2 Spike Antibody (BPS Bioscience, #100793) (right) using the ACE2:SARS-CoV-2 Spike S1 RBD Inhibitor Screening Assay Kit. Absorbance was measured using a BioTek microplate reader. Data shown is lot-specific. For lot-specific information, please contact BPS Bioscience, Inc. at info@bpsbioscience.com.

# TROUBLESHOOTING GUIDE:

Problem	Possible cause	Solution	
Colorimetric signal of	Spike RBD and ACE2- Biotin have lost activity	Proteins lose activity upon repeated freeze/thaw cycles. Use fresh proteins. Store proteins in single-use aliquots. Increase time of enzyme incubation. Increase enzyme concentration.	
is weak	Incorrect settings on instruments	Refer to instrument instructions for settings to increase sensitivity of detection.	
	Colorimetric HRP substrate was not incubated long enough	Increase the amount of time that the colorimetric HRP substrate is incubated in the wells. Avoid azides.	
	Inaccurate pipetting/technique	Run duplicates of all reactions. Use a multichannel pipettor. Use master mixes to minimize errors.	
Colorimetric signal is erratic or varies widely among wells	Bubbles in wells	Pipette slowly to avoid bubble formation. Tap plate lightly to disperse bubbles; be careful not to splash between wells.	
	Signal is out of range of detection (too high)	Decrease the amount of time that the colorimetric HRP substrate is incubated in the wells	
	Insufficient washes	Increase number of washes. Increase wash volume.	
Background (signal to noise ratio) is high	Sample solvent is inhibiting the enzyme	Run negative control assay including solvent. Maintain DMSO level at <1% Increase time of enzyme incubation.	
	Results are outside the linear range of the assay	Use different concentrations of proteins to create a standard curve
